

Another Contest 4 Problem 0 - The April Fools Warmup Problem

Time limit: 1.0s **Memory limit:** 256M

For years, the residents of DMOJistan have been besieged by a single question - what does `AK` stand for?

Well, it's time for you to find out! Please implement the following function:

```
string f()
```

This function should return the phrase that `AK` stands for. Please make sure that you format the phrase properly, as we will be using an `identical` checker to evaluate the correctness of your submission. **You will never need to include newlines in your answer. If you need to use a space in your answer, you will never need to use two consecutive spaces.**

If you don't know what AK stands for, here's a hint: the string you return should have length 8. It contains exactly two words comprising seven letters, with the first word starting with `A` and the second word starting with `K`.

As with all problems in this contest, you will only be permitted to submit your solutions in C++. We guarantee that contestants with no experience in C++ will not be handicapped significantly in spite of this.
