Mirko has chosen four integers which form an arithmetic progression. In other words, when the four numbers are sorted, then the difference between each pair of **adjacent** elements is **constant**.

As has become usual, Mirko lost one of the numbers and also is not sure whether the remaining three are in the correct (sorted) order.

Write a program that, given the three remaining numbers, finds the fourth number.

## **Input Specification**

The input contains 3 integers between -100 and 100 on a single line, separated by single spaces.

Note: the input data will guarantee that a solution, although not necessarily unique, will always exist.

# **Output Specification**

Output any number which could have been the fourth number in the sequence.

## Sample Input 1

468

## Sample Output 1

10

## Sample Input 2

10 1 4

## Sample Output 2
