

VM7WC '16 #2 Bronze - G

Time limit: 1.0s **Memory limit:** 64M

G is a good letter. Here is a 5×5 image of the letter G, made up of smaller G's:

```
GGGGG
G...
G..GG
G...G
GGGGG
```

Since G is such a good letter, we should make it very big. For example, we can increase it to three times the size:

```
GGGGGGGGGGGGGGGG
GGGGGGGGGGGGGGGG
GGGGGGGGGGGGGGGG
GGG.....
GGG.....
GGG.....
GGG.....GGGGGG
GGG.....GGGGGG
GGG.....GGGGGG
GGG.....GGGGGG
GGG.....GGG
GGG.....GGG
GGG.....GGG
GGGGGGGGGGGGGGGG
GGGGGGGGGGGGGGGG
GGGGGGGGGGGGGGGG
```

Even though G is such a good letter, we cannot spend time manually increasing the size of G. Write a program to magnify the given 5×5 image of G automatically.

Input Specification

On one line, the positive integer N ($1 \leq N \leq 25$), how much to magnify the image G. In the example given, $N = 3$.

Output Specification

The output should be $5 \times N$ lines of $5 \times N$ characters each: the magnified image of G.
